AMINES, AMINO ACIDS, AND FATS AS FACIES
INDICATORS IN LOWER RHENISH BROWN COALS
AND THEIR ANALYTICAL DETERMINATION. [1960]
[25]p. 30 refs.

Order from SLA ml\$2. 70, ph\$4. 80 61-10361

Trans. of Braunkohle [Wärme und Energie] (West
Germany) 1960, v. 12, no. 10, p. 472-478.

The investigation shows that it is possible, with the aid of the distribution of amines and amino acids in sediments, to establish a differentiation between marine-influenced and fresh-water brown coals. The differences found between the two facies zones are explained as effects of the conditions of deposition (pH, redox potential, salinity, organisms) and diagenetic processes. The amino acids and amines do not occur in water soluble forms. The fat and boron contents of the same samples show no apparent dependence upon facies. A method for determination of amino acids is described. (Author)

A study was made of the polymerization of epichloro-
hydrin by a number of ionic catalytic systems. It is
shown that the FeCl_3 -propylene oxide "complex"
catalyst can be used to produce polyepichlorohydrin
of regular structure in good yield. The principal

Spectrographic analysis
1. Bakakina, V. V.

Trans. of *Optika i Spektroskopiya (USSR) 1960, v. 9, no. 6, p. 784-786.

Observations were made of the radiation of a discharge of helium and neon excited by a powerful super high frequency (SHF) impulse in a narrow gap placed across a coaxial line. By means of spectrum photography, with the help of visual observations and the photoelectric method, 16 lines of HeI and 24 lines of NeI were found in the red part of the spectrum. Ionic lines were not discovered in either gas. The intensity of the helium and neon lines follows almost exactly the amplitude changes of the SHF signal for helium to pressures of 10 mm mercury and for neon at pressures lower than (Physics--Electronics, TT, v. 5, no. 12) (over)
